

house-price-prediction

April 9, 2024

ABOUT THE DATASET

The aim of this project is to develop a predictive model for housing prices in Washington State using a data-driven approach. By harnessing the power of machine learning and data analysis, we will explore historical housing data, including factors such as location, square footage, number of bedrooms, and more, to create an accurate prediction model.

1. Date: This column contains the date when a particular property transaction occurred.
2. Price: This column contains the selling price of the house.
3. Bedrooms: This column indicates the number of bedrooms in the house.
4. Bathrooms: This column shows the number of bathrooms in the house.
5. Sqft_living: This column represents the total square footage of the living space (interior) of the house.
6. Sqft_lot: This column is likely the total square footage of the land or plot on which the house is built.
7. Floors: It indicates the number of floors in the house.
8. Waterfront: It's a binary column that could indicate whether the property has a waterfront view or not.
9. View: This column might describe the level of view the property has, typically on a scale from 0 to 4, with 0 being no view and 4 being an excellent view.
10. Condition: This column could represent the overall condition of the property, often rated on a scale from 1 to 5, with 1 being poor and 5 being excellent.
11. Sqft_above: This column likely shows the square footage of the interior living space above ground level.
12. Sqft_basement: This column should contain the square footage of any basement space in the house.
13. Yr_built: This is the year the house was originally built.
14. Yr_renovated: If the house has been renovated, this column may contain the year when the renovation took place.
15. Street: This column might provide information about the street or address of the property.
16. City: It represents the city where the property is located.

17. Statezip: This column could contain information about the state and ZIP code of the property.
18. Country: In this context, it's likely that all entries are from the same country, so this column may not provide much variation.

IMPORTING REQUIRED LIBRARIES

```
[258]: import numpy as np
import pandas as pd
import matplotlib.pyplot as plt
import seaborn as sns
```

IMPORTING DATASET

```
[259]: df=pd.read_csv('/content/data1.csv')
